Software Engineer, Early Career, Campus

Dear Google Hiring Team,

I am applying for the Software Engineer, Early Career, Campus position at Google. I earned my B.S. in Computer Science from Florida State University and most recently worked as a Software Engineer at Amazon Prime Video, where I built backend services, distributed data-processing systems, and AWS infrastructure for a large-scale metadata platform.

At Prime Video, I worked on the Unified Metadata Platform, which was built to replace fragmented catalog systems with centralized services managing millions of content records. I developed Java backend services, designed ingestion pipelines for partner-supplied metadata, and built the supporting AWS infrastructure. My work regularly crossed application and infrastructure boundaries, particularly when unusual production inputs exposed failure cases that were difficult to reproduce in development.

One project I am especially proud of started during my Prime Video internship. I designed and built a metadata ingestion service that automated validation and transformation for malformed partner submissions. Before that service, some submissions required roughly six hours of manual preprocessing. I owned the project from technical design through implementation, testing, deployment, and production rollout. I later returned to the same organization full-time and continued working on the larger platform and its distributed processing systems.

My experience has also taken me outside backend development. At the University of Central Florida's VR Lab, I built interactive applications using Unity, Unreal Engine, C#, and VR tooling. At Green Bank Observatory, I worked on APIs and data systems supporting the Skynet Robotic Telescope Network. More recently, I have incorporated AI-assisted development tools into my daily workflow to explore codebases, debug problems, iterate on implementations, and reduce repetitive development work.

What appeals to me about this role is the breadth. I do not want to limit myself to one narrow layer of software engineering this early in my career. I have developed a strong foundation in backend and distributed systems, but I also enjoy learning unfamiliar technologies and moving across a system when the problem requires it. Google's ability to let engineers grow across products, systems, and technical areas is a strong match for how I want to develop as an engineer.

Thank you for considering my application. I would welcome the opportunity to bring the production experience I have gained so far to Google while continuing to grow across large-scale systems and product engineering.

Sincerely,

Juliana Oyola-Pabon
